

CONCEPT MAP

NAME : NIVASINI.VN
REGNO : 192511356

2)

The concept map shows that input size affects recursion depth. As the input size increases, the recursion depth also increases. Each recursive call creates a new stack frame, so a greater recursion depth results in more stack. These stack frames consume auxiliary memory, increasing the auxiliary space required by the algorithm. Therefore the space complexity of a recursive algorithm generally requires more stack space than iterative algorithms.
